

Viega Project Profile

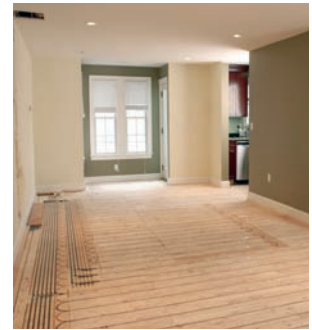

NO. 123

“The new Multi-Run Climate Panels work great.”

Tim Cutler, TJ's Plumbing & Heating Inc.

Multi-Run Climate Panels are a new addition to the cleanest, most responsive, convenient radiant solution for new construction or retrofit installations.

The Viega Climate Panel® System speeds installation while reducing the prep time and mess associated with concrete pours.

CHALLENGE

Multiple days of below-zero temperatures can be expected when living in Somerville, MA. That's why new homeowners moving to the area called on TJ's Plumbing and Heating, Inc., to design a radiant heating system that would offer the highest level of personal comfort.

SOLUTION

Knowledgeable of cutting edge radiant advancements, TJ's Plumbing & Heating incorporated Viega's new Multi-Run Climate Panel System into the radiant design. "I did the layout utilizing Viega's Rad Wiz software. I use it every time. For bigger projects I utilize Viega's design service and their expertise," said Cutler. By using one Multi-Run Panel, TJ's Plumbing & Heating had six supply and return lines and a row of U-Turns using only 12" of floor space. Typically, the same scenario would have required six standard Climate Panels and a U-Turn Strip totaling 49" of used floor space. The entire radiant system in this home consisted of 14 circuits and 3,000 feet of 5/16" ViegaPEX™ Barrier tubing. "I love the barrier tubing. It seems more flexible than regular tubing and it snaps right into the surface," said Cutler.

RESULTS

Together, Viega and TJ's Plumbing & Heating, were able to provide the Massachusetts homeowners with the comfort, efficiency and reliability they requested. Pleased with the results, Tim Cutler affirms, "I have another Viega radiant job scheduled next week."
